AFFILIATE MARKET CONNECT · DONE-FOR-YOU WEBSITE

Affiliate Theme Setup Guide

Install and activate the theme, create your own business email address for free hello@yourdomain.com, connect your Resend account, and add your affiliate link. Activating the theme creates your landing pages, privacy policy, terms of service, affiliate disclosure, earnings disclaimer, your email automation sequences, writes all the copy, and configures everything. Publish any landing page, all legal pages, and turn on your landing page's email automation sequence, and you're ready to send to traffic.

WHAT YOUR SITE DOES WHEN YOU FINISH

1. A visitor lands on your landing page
2. They type their email into the form
3. The form's button sends their browser to your affiliate link
4. Your email automation sequence is sent out automatically

BEFORE YOU START

Have these five things ready

- [ ] **A WordPress site you can log into as an administrator.** The theme needs WordPress 6.6 or newer and PHP 8.1 or newer. Any good host meets both.
- [ ] **A domain whose DNS records you can edit.** Your emails are sent from it, so you add a few records to it in Step 7. Cloudflare makes this easy, and it's free. If your host doesn't let you edit DNS records, your site can't send the emails.
- [ ] **Your postal mailing address.** U.S. law requires one at the bottom of every marketing email, so the emails don't start until it's filled in.
- [ ] **Your affiliate link**: the full link from WarriorPlus, starting with `https://`.
- [ ] **The theme file,** `affiliate-theme.zip`, from the **Domain + Web Hosting** step of your members area.

You also need a free Resend account. Step 5 shows you how to make one.

The eleven steps at a glance

	STEP	WHERE
1	Download the theme	Your members area
2	Upload and install it	**Appearance** › **Themes** › **Add Theme**
3	Activate it	**Appearance** › **Themes**
4	Set your permalinks	**Settings** › **Permalinks**
5	Create your Resend account and API key	resend.com
6	Fill in the theme's settings and save	**Settings** › **Affiliate Theme Settings**
7	Add your DNS records and click Check	Where your domain's DNS is managed
8	Edit and publish your landing page	The block editor
9	Make the landing page your home page	**Settings** › **Reading**
10	Fill in and publish your legal pages	The block editor
11	Point WordPress at your Privacy Policy	**Settings** › **Privacy**

STEP 1

Download the theme

Go to affiliatemarketconnect.com/members/domain-web-hosting.

Download your DFY website `affiliate-theme.zip`.

Keep it zipped. WordPress installs the `.zip` file exactly as you downloaded it. Don't open it, rename it, or change what's inside.

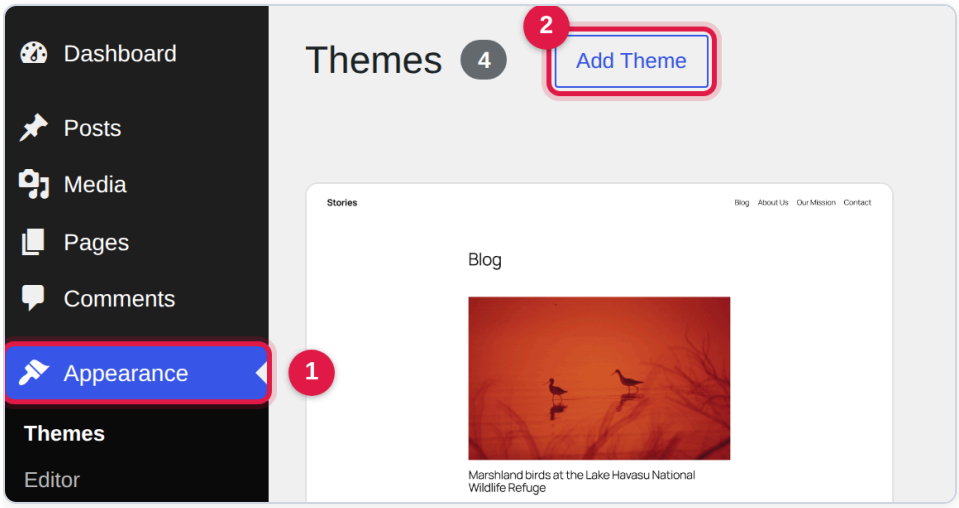

> **On a Mac, Safari may unzip it for you**
> If your Downloads folder shows a folder called `affiliate-theme` instead of `affiliate-theme.zip`, right-click the folder and choose **Compress "affiliate-theme"**. That makes a new `affiliate-theme.zip` you can upload. To stop Safari doing this, turn off **Safari** › **Settings** › **General** › **Open "safe" files after downloading**.

STEP 2

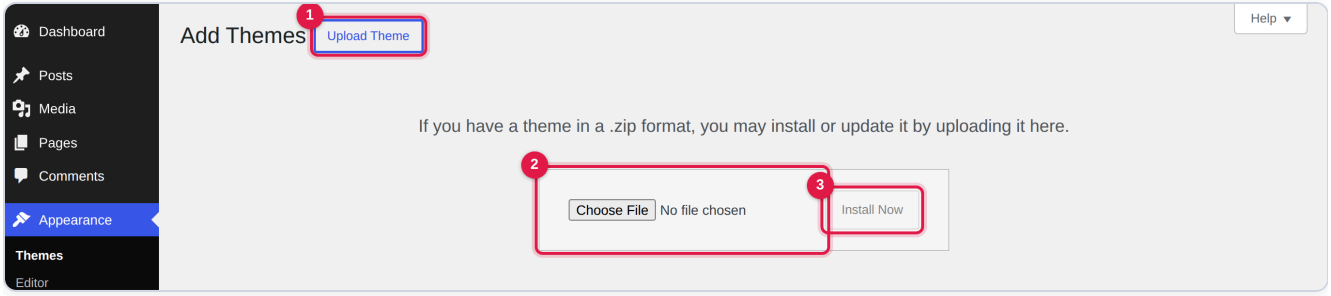

Upload and install the theme

Go to **wp-admin › Your dashboard yoursite.com/wp-admin**.

1. In the left menu, click **Appearance**. The **Themes** screen opens.
2. Click **Add Theme** at the top.

1. Click **Upload Theme** next to the **Add Themes** title.
2. Click **Choose File** and pick `affiliate-theme.zip`.
3. Click **Install Now**. After a few seconds WordPress says **Theme installed successfully.**

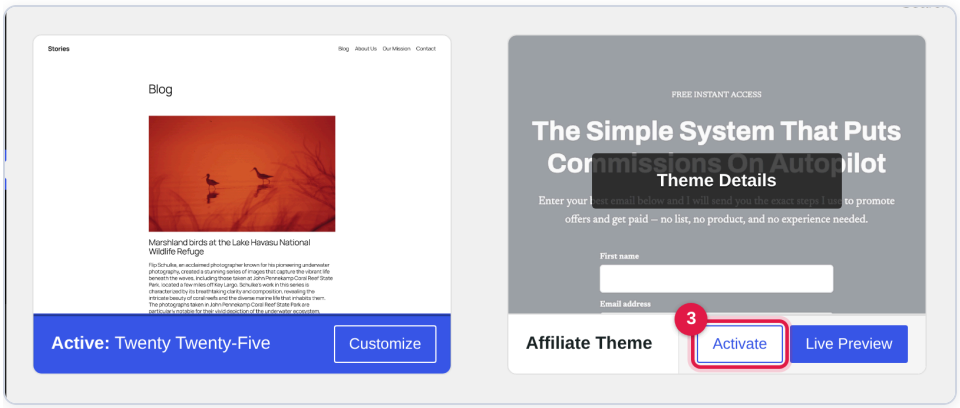

STEP 3

Activate the theme

Go to **Appearance** › **Themes**.

Click **Activate** or point at the **Affiliate Theme** card and click **Activate**.

What activation creates for you

The moment you activate it, the theme adds seven pages, all as drafts:

- **Three landing pages**, the same offer in three layouts: *Landing Page – Centered*, *Landing Page – Split* and *Landing Page – Long Form*. You'll use one.
- **Four legal pages**: *Privacy Policy*, *Terms of Service*, *Earnings Disclaimer* and *Affiliate Disclosure*.

It also adds a new screen, **Settings** › **Affiliate Theme Settings**, with three sections, **Resend**, **Sender** and **Funnel**. You fill it in during Step 6.

Nothing goes public until you publish it

The theme creates every page as a draft. You can take your time with each step. Visitors see a page only after you click **Publish**.

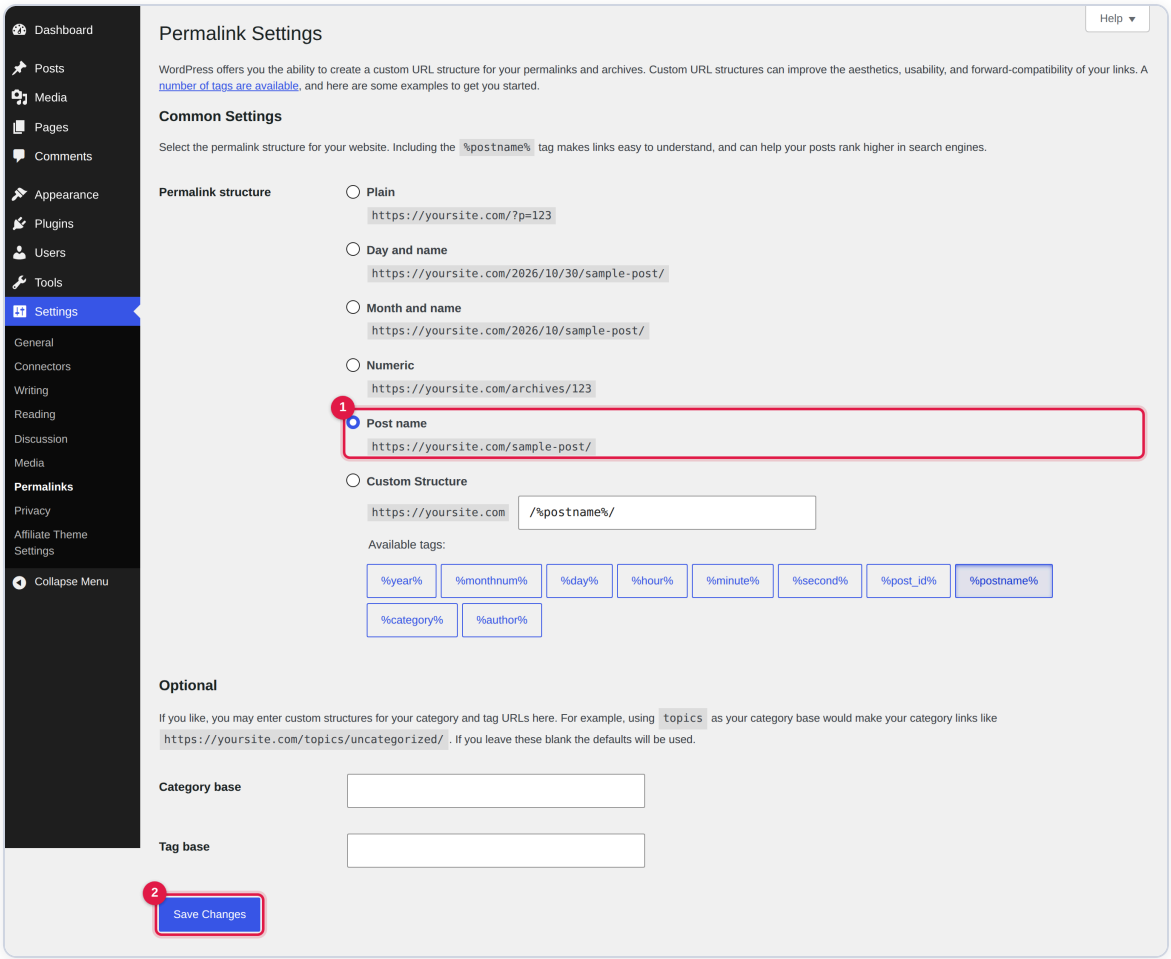

STEP 4

Set your permalinks

Go to **Settings** › **Permalinks**.

Permalinks are your pages' web addresses. **Post name** gives each page a short, readable one, such as **yoursite.com/privacy/**. Set it now, before you publish anything, so no address changes after you share it.

1. Under **Permalink structure**, choose **Post name**. The **Custom Structure** box below it changes to `/%postname%/`.
2. Click **Save Changes** at the bottom of the screen.

STEP 5

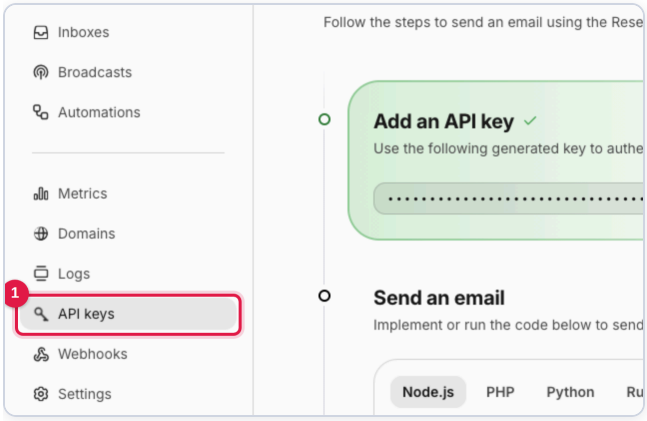

Create your Resend account and API key

Go to **resend.com › API keys**.

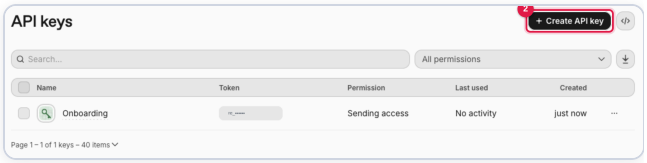

Resend is the email service that sends your welcome emails. The theme sets everything up in your own Resend account, so you never have to build an email in Resend yourself. It only needs a key that lets it do that.

Go to **resend.com** and sign up for a free account. Then make the key:

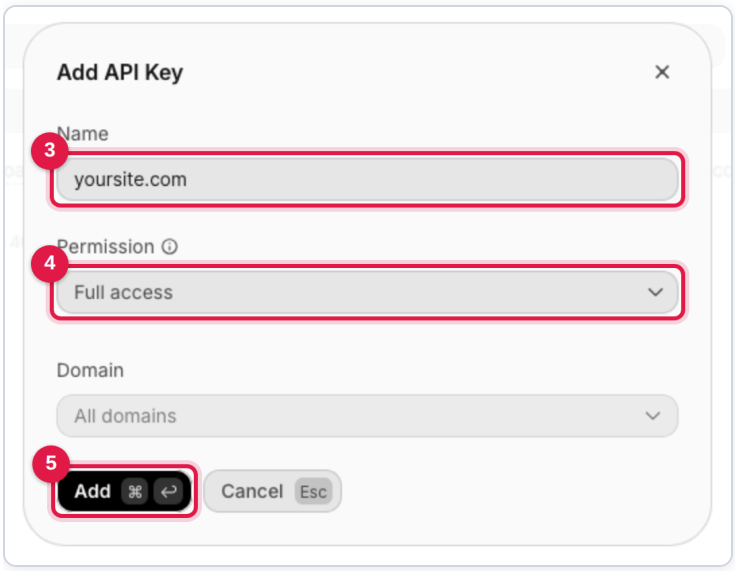

1. In the left menu, click **API keys**.

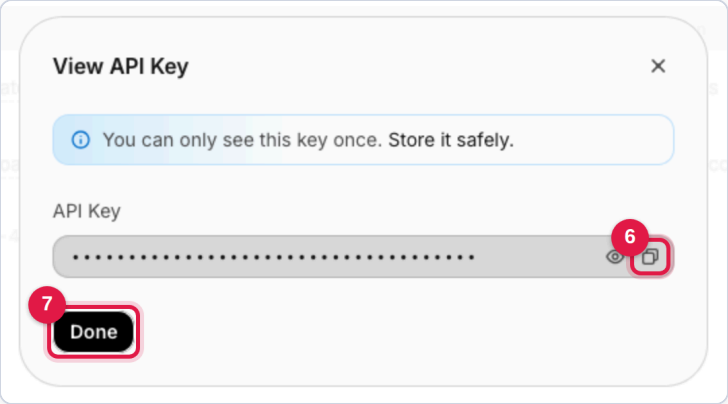

2. Click **Create API key**. The *Onboarding* key Resend made for you can only send email, so the theme can't use it.

3. Under **Name**, type a name you'll recognize, such as your site's address.
4. Under **Permission**, choose **Full access**. This matters: the theme adds your domain and your emails to Resend, and a key with **Sending access** can't do that. Leave **Domain** at **All domains**.
5. Click **Add**.

6. Click the copy button at the end of the key. **Resend shows the key only once**, so paste it straight into the theme's settings (Step 6), or somewhere safe until then.
7. Click **Done**.

Keep your key private

A Full access key controls your whole Resend account. Never paste it into a page, an email or a chat. The theme keeps it on your server and never shows it again: after you save, its field shows only dots.

Resend's free plan

At the time of writing, Resend's free plan sends 100 emails a day and 3,000 a month, and holds 1,000 contacts. Check the current numbers on Resend's pricing page (**resend.com/pricing**).

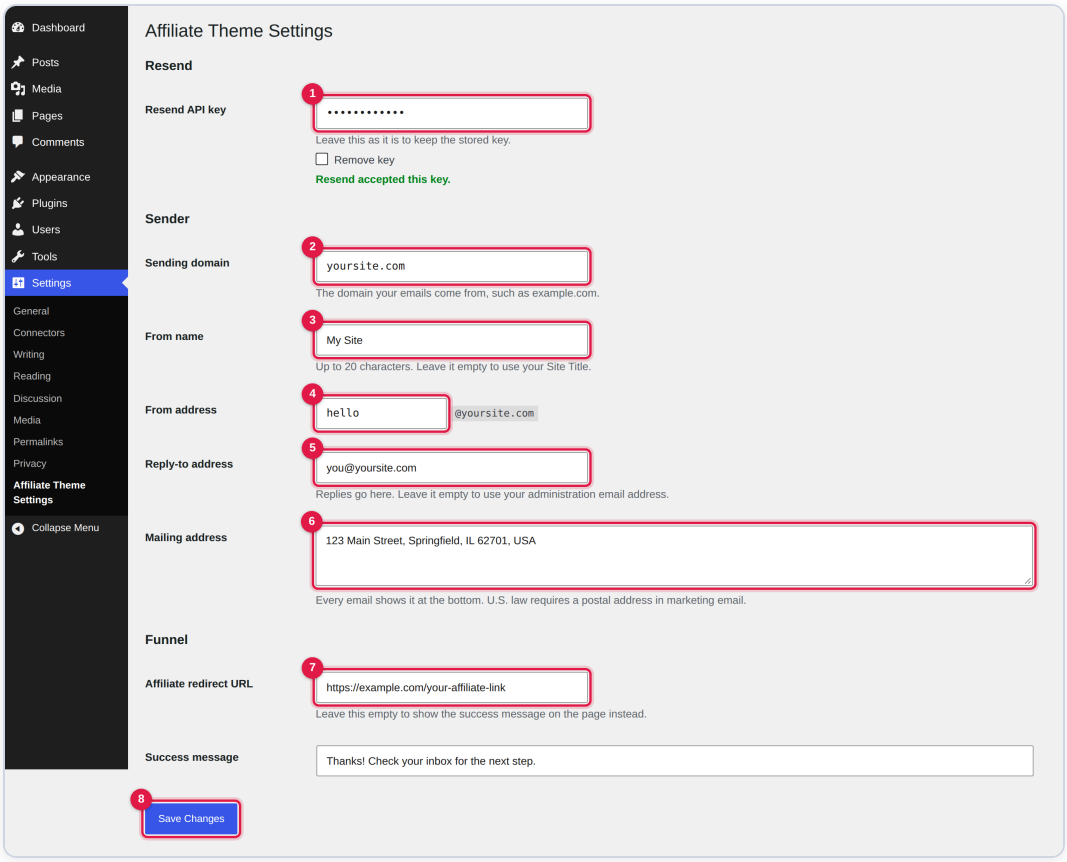

- Each new subscriber gets 6 emails over 28 days from the Centered and Long Form pages, or 5 emails over 4 days from the Split page.
- Every subscriber stays a contact in Resend after their emails end, and counts toward the contact limit.
- Starting on the free plan is fine. The theme doesn't show your usage, so check it in Resend, under **Metrics**, once you start sending traffic.
- When you outgrow it: at the time of writing, **Transactional Pro** ($20 a month) sends 50,000 emails a month with no daily limit, but keeps 1,000 contacts. **Marketing Pro** ($40 a month) raises contacts to 5,000, and higher tiers go further.

STEP 6

Fill in the theme's settings and save

Go to **Settings › Affiliate Theme Settings**.

This one screen wires up your whole funnel. Fill it in from top to bottom. The numbers match the screenshot.

1. **Resend API key.** Paste the key from Step 5. After you save, the line under it reads **Resend accepted this key.**

2. **Sending domain.** The domain your emails come from, usually your site's own domain, typed like `yoursite.com` (no `https://`, no `www.`). Saving adds it to your Resend account. If it's already in your Resend account, the theme uses it as it is.

3. **From name.** The name your subscribers see, 20 characters at most. Leave it empty to use your Site Title.

4. **From address.** The part before the `@`. `hello` is filled in for you, so your emails come from `hello@yoursite.com`.

5. **Reply-to address.** Where replies go: an inbox you read. Leave it empty to use your WordPress administration email address. To read replies in Resend instead, see *Optional: read replies in Resend* in

Step 7.

6. **Mailing address.** Your postal address. Every email shows it at the bottom, and no email goes out without it.

7. **Affiliate link.** Paste your full affiliate link, starting with `https://`. The form and your emails send each new subscriber here.

8. Click **Save Changes**.

> **What happens when you save**
>
> The theme goes to work in your Resend account. Leave the page open and don't touch anything until it's done. Waiting time: about 1 minute.
>
> - The theme adds your domain to your Resend account, and waits until your domain's DNS records are verified.
> - The theme writes your emails for each landing page, and creates templates and automations in your Resend account.

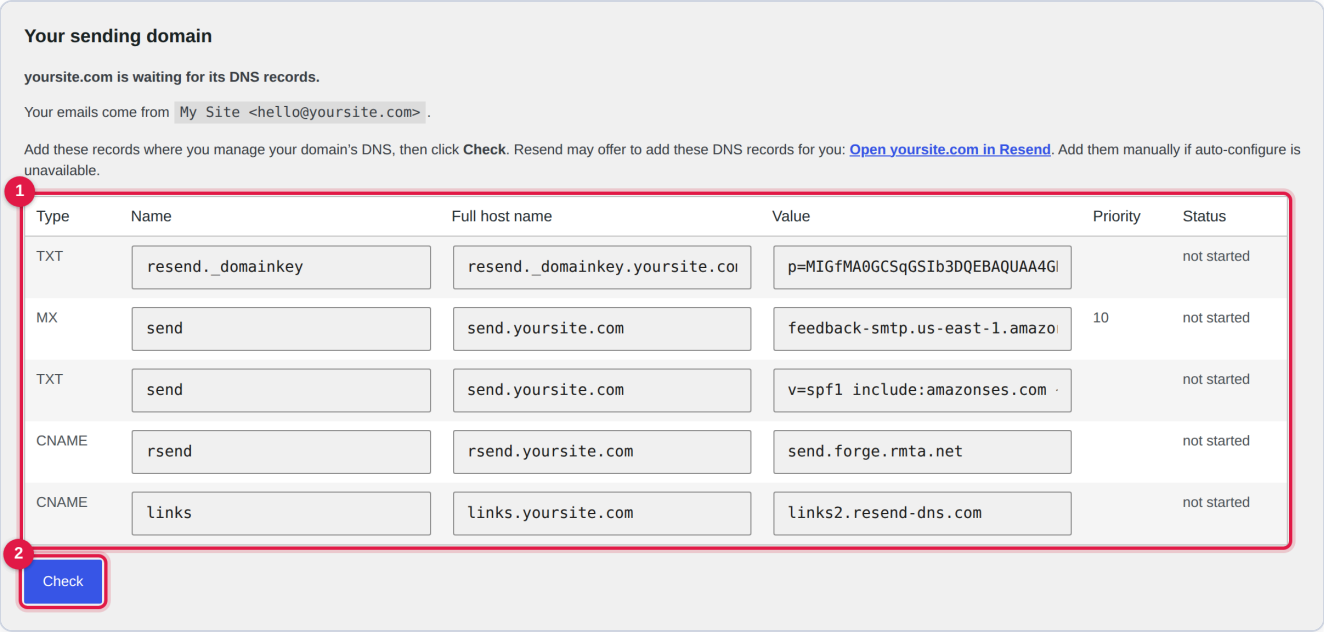

STEP 7

Add your DNS records

Go to **Settings** › **Affiliate Theme Settings** and scroll down to **Your sending domain**.

Resend needs to verify your domain before it sends a single email from it. You prove the domain is yours by adding the five DNS records that **Your sending domain** lists.

Add all five before you click **Check**.

1. Add each record where your domain's DNS is managed (at Cloudflare, or at the company you bought the domain from). Copy each value from the table: click a box and it selects itself. Every record has to be added, including the last one, `links`, which lets Resend record when your emails are opened and their links clicked, as your Privacy Policy explains. Resend may offer to add the records for you on its own page for your domain (**Open yoursite.com in Resend**). If it doesn't, add them by hand, as shown below.

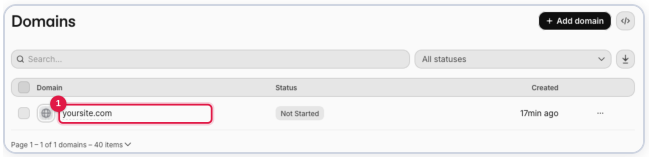

2. Click **Check**. Resend checks the records and verifies the domain by itself, usually within a few minutes, sometimes a few hours. Click **Check** again later if it still says the records are missing.

The same records in Resend

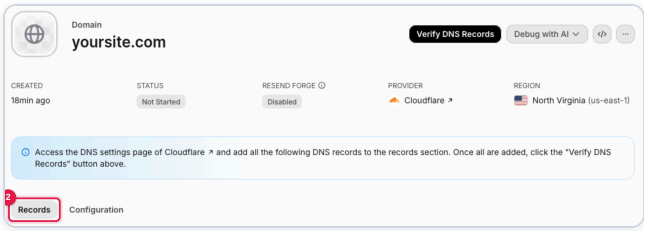

In Resend, under **Domains**, click your domain, then its **Records** tab. Resend shows the same five records there: one under **Domain Verification**, three under **Enable Sending** and one under **Enable Tracking**.

Each row gives a record's **Type**, **Name**, **Content**, **TTL** and, for the MX record, **Priority**. Copy each value into the same field where your DNS is managed. Where Resend's **Proxy status** column reads **DNS Only**, set that record's proxy the same way on Cloudflare (see *Adding the records on Cloudflare* below).

1 Your domain in **Domains**.

2 Its **Records** tab.

Domain Verification

DKIM

Type	Name	Content	TTL
TXT	resend._domainkey ✓	p=MIGfMA0GCSqG […] Zp23jlQIDAQAB ✓	Auto

Enable Sending

SPF

Type	Name	Content	Proxy status	TTL	Priority
MX	send	feedback-smtp. […] amazonses.co		Auto	10
TXT	send	v=spf1 include […] nses.com ~al		Auto	
CNAME	rsend	send.forge.rmta.net	DNS Only	Auto	

Enable receiving

Enable Tracking

Type	Name	Content	TTL	Priority
CNAME	links	links2.resend-dns.com	Auto	

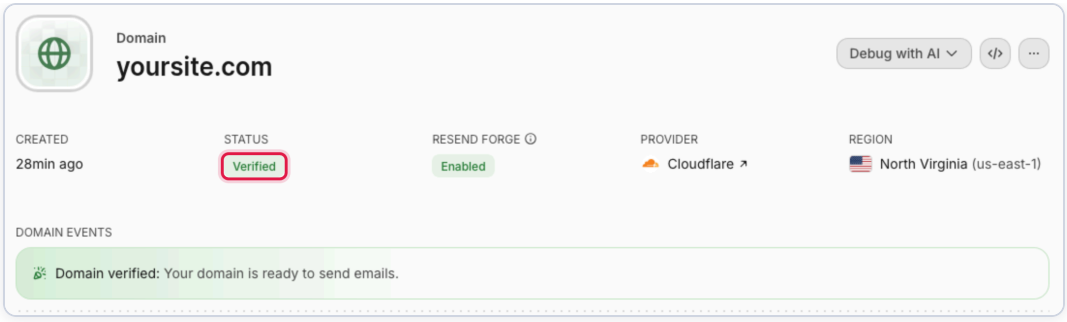

Then click Check

Back in **Affiliate Theme Settings**, click **Check**. Resend checks your records and verifies the domain, usually within a few minutes. Until it does, your email sequences wait.

When the domain is verified

Resend shows **Verified** on your domain's page. Open **Affiliate Theme Settings**, or reload it if it's already open. The theme sees that the domain is verified and turns your email sequences on, and **Your email sequences** shows each one as **Live**.

If **Your sending domain** still says yoursite.com is waiting for its DNS records., click **Check** once more, then give it time. Resend verifies the domain by itself, so you don't need to keep clicking.

Your email sequences

The theme sets these up in your Resend account, under Templates and Automations. Their names start with Affiliate Theme.

Landing page	Emails	Status	Actions
Centered	6 emails over 28 days	**Live** Live. New sign-ups on this page get these emails.	☐ Replace my edits in Resend Turn off · Reset these emails to the theme's copy Open in Resend
Split	5 emails over 4 days	**Live** Live. New sign-ups on this page get these emails.	☐ Replace my edits in Resend Turn off · Reset these emails to the theme's copy Open in Resend
Long Form	6 emails over 28 days	**Live** Live. New sign-ups on this page get these emails.	☐ Replace my edits in Resend Turn off · Reset these emails to the theme's copy Open in Resend

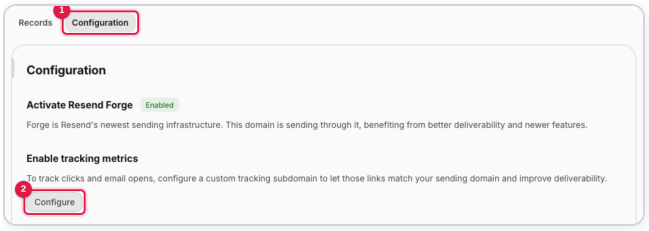

Turning a sequence off also stops the remaining emails of everyone partway through it.

If your domain was already in Resend

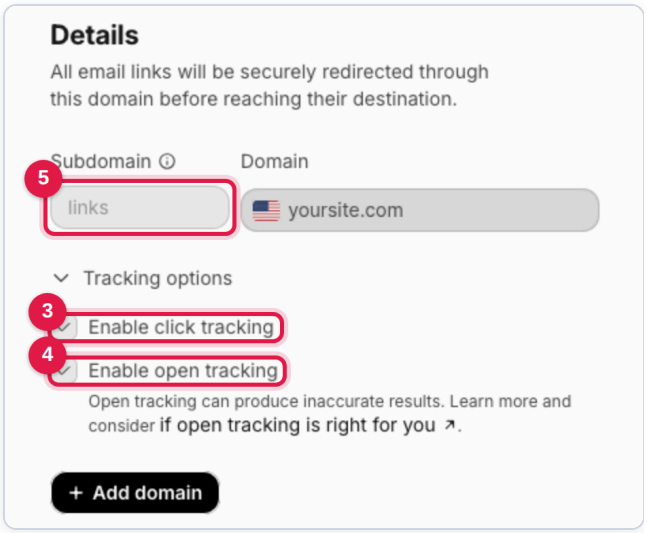

If you'd added your domain to Resend before you installed the theme, the theme uses it as it is. If that domain has no tracking subdomain yet, add one as below, **before** your email sequences go live: until its new record is verified, Resend can't send from the domain, and the theme turns your sequences off.

1. In Resend, open your domain and click its **Configuration** tab.
2. Under **Enable tracking metrics**, click **Configure**.
3. Tick **Enable click tracking**.
4. Tick **Enable open tracking**.
5. Type `links` as the **Subdomain**, and go on to the next screen.
6. Add the CNAME record it shows. Click **Auto configure** if Resend offers it, or add the record by hand where your DNS is managed. Then click **I've added the record**.

Configuration and Configure.

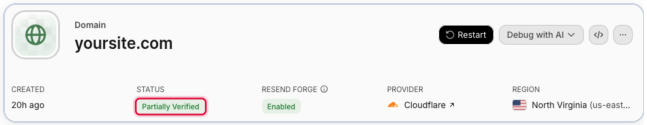

The tracking subdomain and its options.

The record to add.

Until the new record is verified, the domain reads **Partially Verified** and can't send.

Optional: read replies in Resend

When a subscriber replies to one of your emails, the reply goes to your **Reply-to address**. To read replies inside Resend instead of another inbox, do this once your domain is verified.

> **Skip this if you already get email at your domain**
> This adds a mail record to your domain itself, so mail sent to any address at `yoursite.com` goes to Resend. If you already read email at an address like `you@yoursite.com` (through Google Workspace, Outlook or your host), leave this alone and keep your **Reply-to address** pointed at that inbox. To check, look in Cloudflare's DNS records for an `MX` record whose name is your domain itself. Resend's own `MX` record on `send` doesn't count.

1. In Resend, open your domain's **Records** tab and switch **Enable receiving** on.
2. Add the `MX` record it shows in Cloudflare, as you added the others: **Type** `MX`, its **Name**, its value as the **Mail server**, and **Priority** `10`. Resend shows **Verified** next to it within a few minutes. Your emails keep sending while it's pending.
3. In Resend, open **Inboxes** and create an inbox for your From address, such as `hello@yoursite.com`.

4. In **Affiliate Theme Settings**, set **Reply-to address** to that same address and click **Save Changes**. The theme updates all your emails.

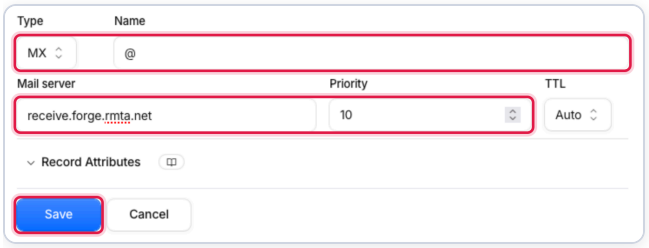

Enable receiving.

The record to add.

Adding it on Cloudflare.

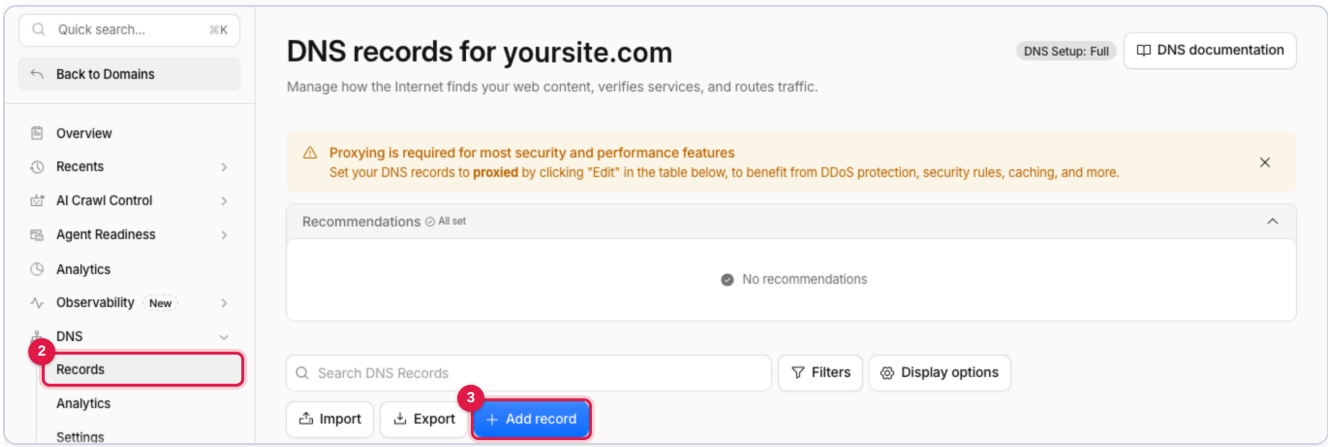

Replies then arrive under **Inboxes**. A reply that came in before you created the inbox is under **Emails** › **Receiving**.

Adding the records on Cloudflare

1. On your Cloudflare home page, click your domain.

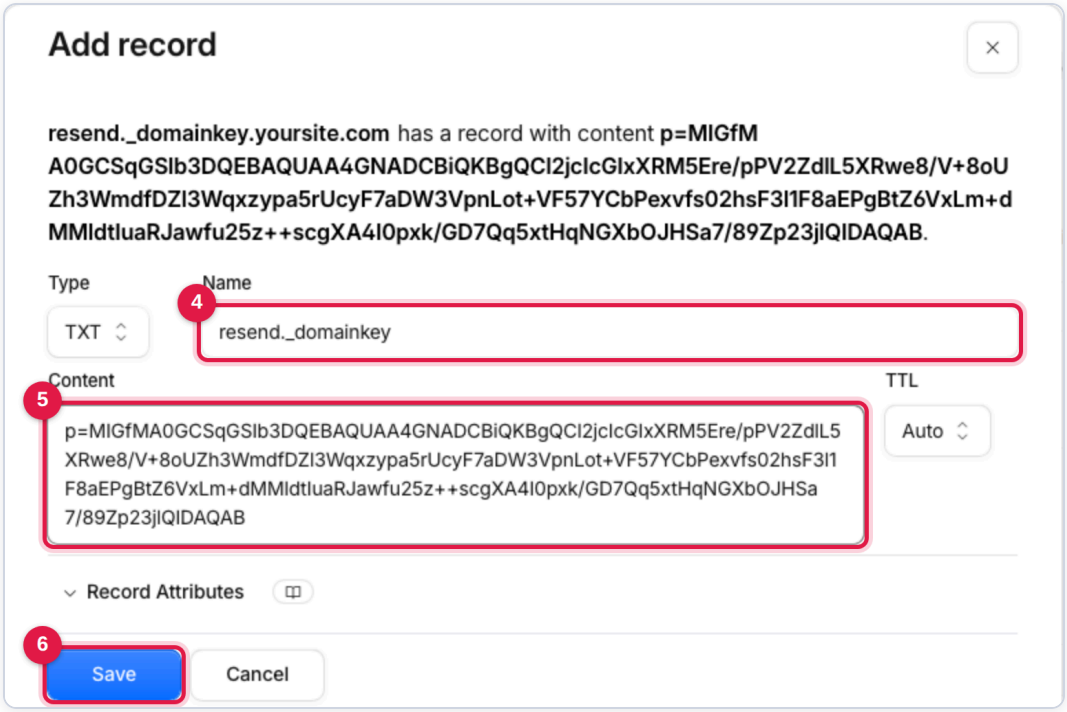

2. In the left menu, open **DNS** and click **Records**.
3. Click **Add record**.

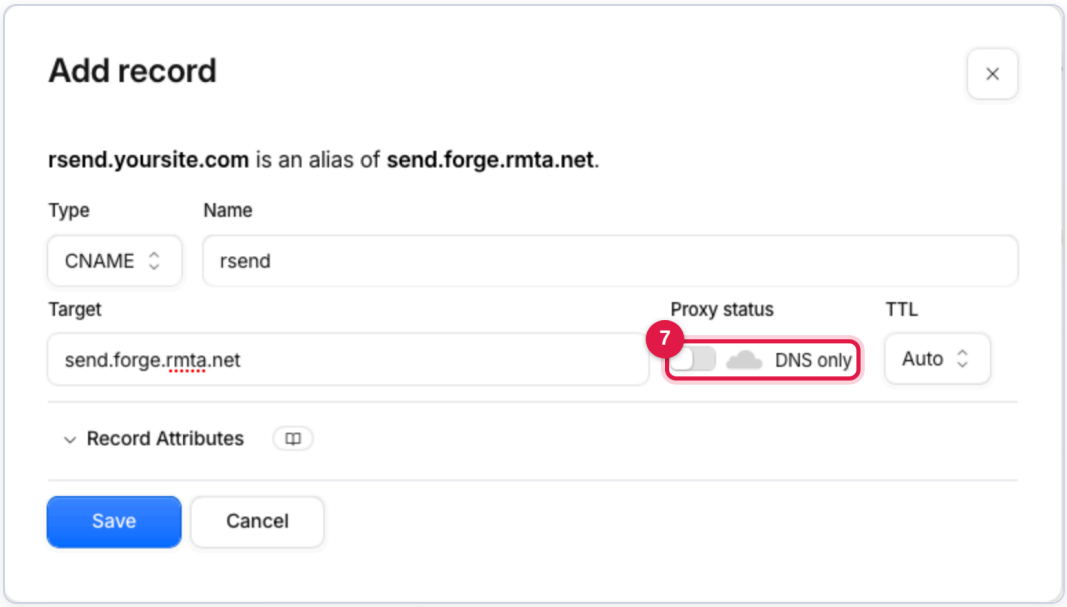

4. Choose the record's **Type** and paste its **Name**.

5 Click **Save**. Then click **Add record** for the next one, until all five are in.

7 On the two CNAME records, turn the **Proxy status** switch off, so it reads **DNS only** with a grey cloud. A proxied (orange) record can't be verified.

STEP 8

Edit and publish your landing page

Go to **Settings** › **Affiliate Theme Settings** scroll down to **Your landing pages**. Click a link to open it in the editor and preview its layout.

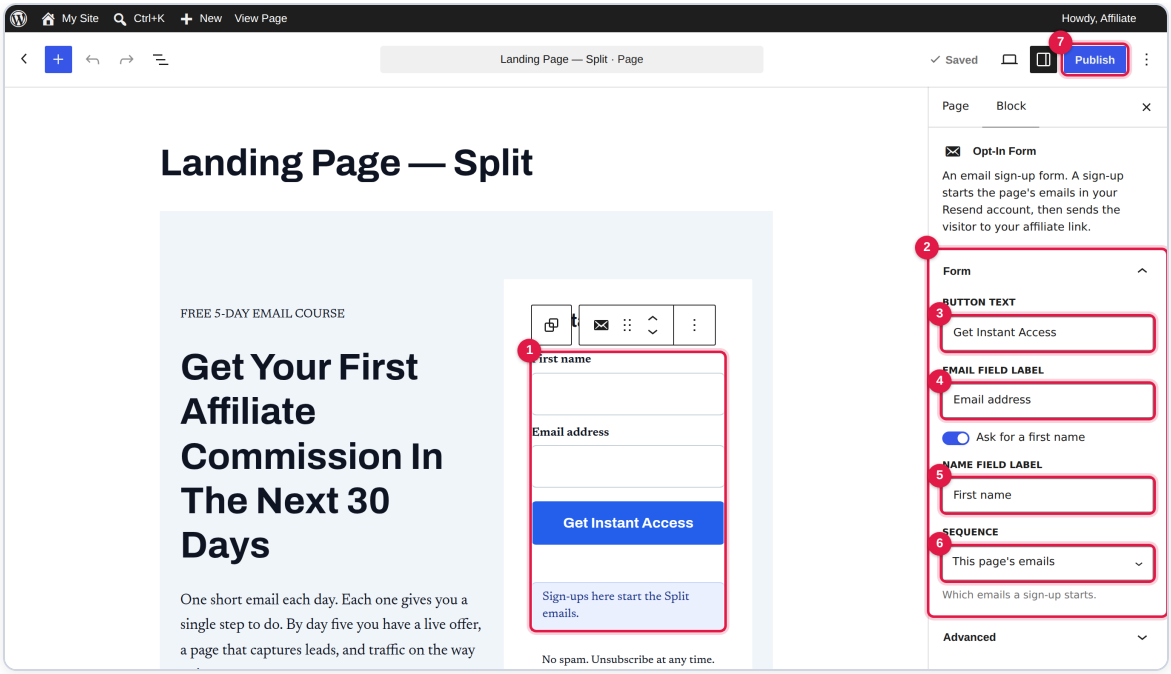

Publish only the landing page you use

Every published page is added to your site's menu automatically, so leave the other two layouts as drafts. A published page can always be unpublished back to a draft.

Every headline, paragraph, list and image can be edited: click it and type, or replace the image. The opt-in form can also be edited through the sidebar:

1. Click the form.
2. The **sidebar** on the right holds its:
3. **Button text**
4. **Email field label**
5. **Name field label**
6. **This page's emails**: each landing page has its own email sequence, written to keep that page's promise.
7. Click **Publish**.

How your page looks in Google and when it's shared

The theme writes a description, a social preview and search data for each page. Three things decide what they say:

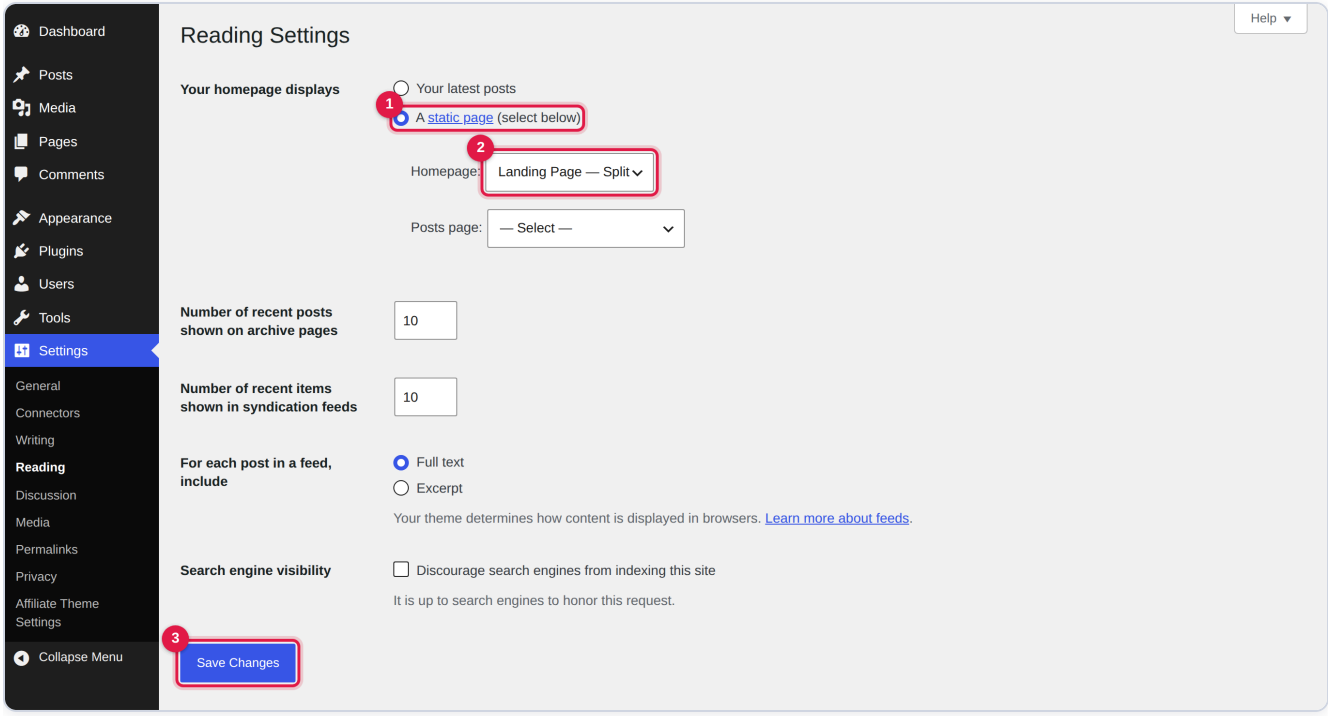

- **Settings** › **General**. The **Site Title** and **Tagline** are what Google, Facebook, X, and LinkedIn show as your site's preview when shared. The **Site Icon** is the picture that the browser tab shows for your site and a shared link shows when its page has no featured image.
- **Featured image**: the picture shown when someone shares your landing page. 1200px × 630px.
- **Excerpt**: the description Google shows under your title. Leave it empty to use the first paragraph after the first headline of your page.

STEP 9

Make the landing page your home page

Go to **Settings** › **Reading**.

1. Under **Your homepage displays**, choose **A static page (select below)**.
2. In the **Homepage** list, choose the landing page you published in Step 8.
3. Click **Save Changes**.

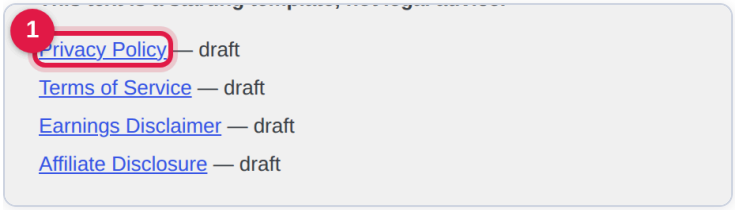

Now visit your site's address. Your landing page is the first thing people see.

> **Is your landing page missing from the list?**
>
> This list shows only published pages. Go back to Step 8 and click **Publish**.

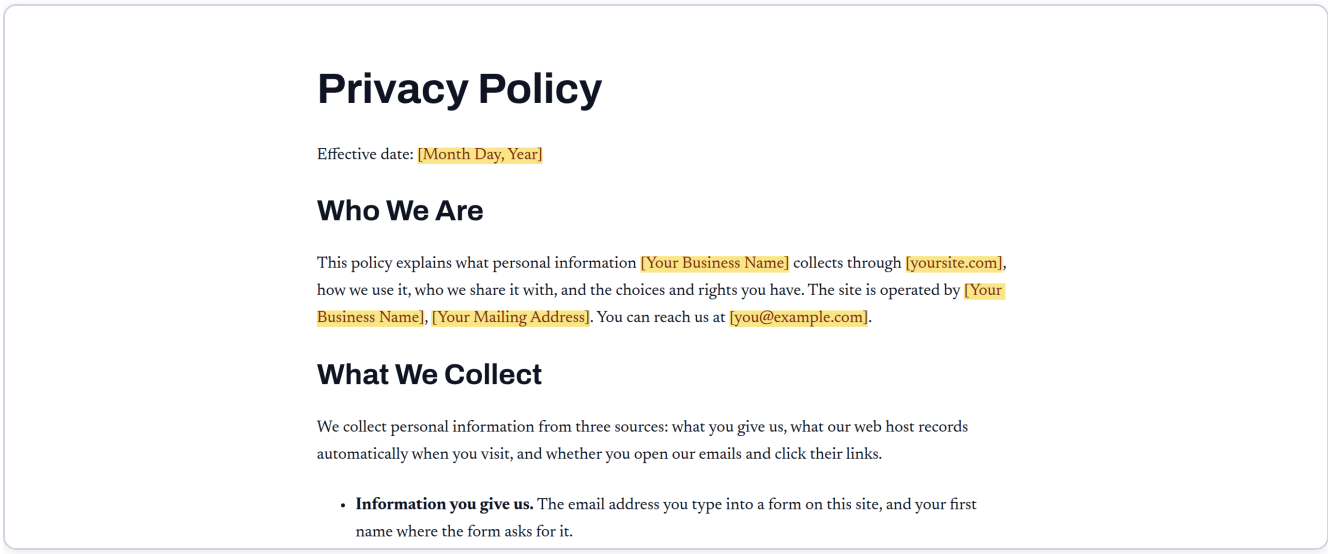

STEP 10

Fill in and publish your legal pages

Go to **Settings** › **Affiliate Theme Settings** scroll down to **Your legal pages**. Click each page's link to open it in the editor.

Each page is written in plain English and uses square-bracket placeholders wherever your own details belong. Replace **every** one, on all four pages, **before** you publish: a published page joins your site's footer straight away. Each placeholder is spelled the same way everywhere, so your browser's find command (`Ctrl + F` , or `Cmd + F` on a Mac) finds them all.

Privacy Policy

Effective date: [Month Day, Year]

Who We Are

This policy explains what personal information [Your Business Name] collects through [yoursite.com], how we use it, who we share it with, and the choices and rights you have. The site is operated by [Your Business Name], [Your Mailing Address]. You can reach us at [you@example.com].

What We Collect

We collect personal information from three sources: what you give us, what our web host records automatically when you visit, and whether you open our emails and click their links.

- **Information you give us.** The email address you type into a form on this site, and your first name where the form asks for it.

Placeholders are highlighted here to show them. In your editor they look like ordinary text.

PLACEHOLDER	REPLACE IT WITH
[Your Business Name]	Your name or your business's legal name
[yoursite.com]	Your domain, for example *mysite.com*
[you@example.com]	An email address where visitors can reach you
[Your Mailing Address]	Your postal address, the same one as in your emails
[Your State/Country]	The state or country whose law applies to your business
[Month Day, Year]	The date the page takes effect, usually the day you publish it

Then click **Publish** on each page. A published legal page adds its own link to your site's footer, and that footer also appears at the bottom of your landing page. Draft pages are never linked.

Keep each page true to your business. These pages are a starting template, not legal advice.

If you add analytics, advertising or cookies

Your Privacy Policy says you don't sell or share visitors' information. That stays true only while your site runs no analytics, no advertising pixels and no tracking cookies. If you start using Google Analytics, any advertising platform or cookies, replace that section of your Privacy Policy:

1. Go to your dashboard **yoursite.com/wp-admin**
2. **Appearance › Editor**
3. **Pages**
4. Open your *Privacy Policy* page in the editor.
5. Remove the *We Do Not Sell Or Share Your Information* heading and the paragraph after it.
6. Click the **+** button in the top-left corner.
7. Switch from the **Blocks** tab to the **Patterns** tab.
8. Choose **Affiliate Theme**.
9. Choose *Legal – Privacy: Analytics and Advertising* and it will insert itself where the removed section was, after *Who We Share It With*. Replace its `[Provider Name]` with each tool you use. Then click **Save**.

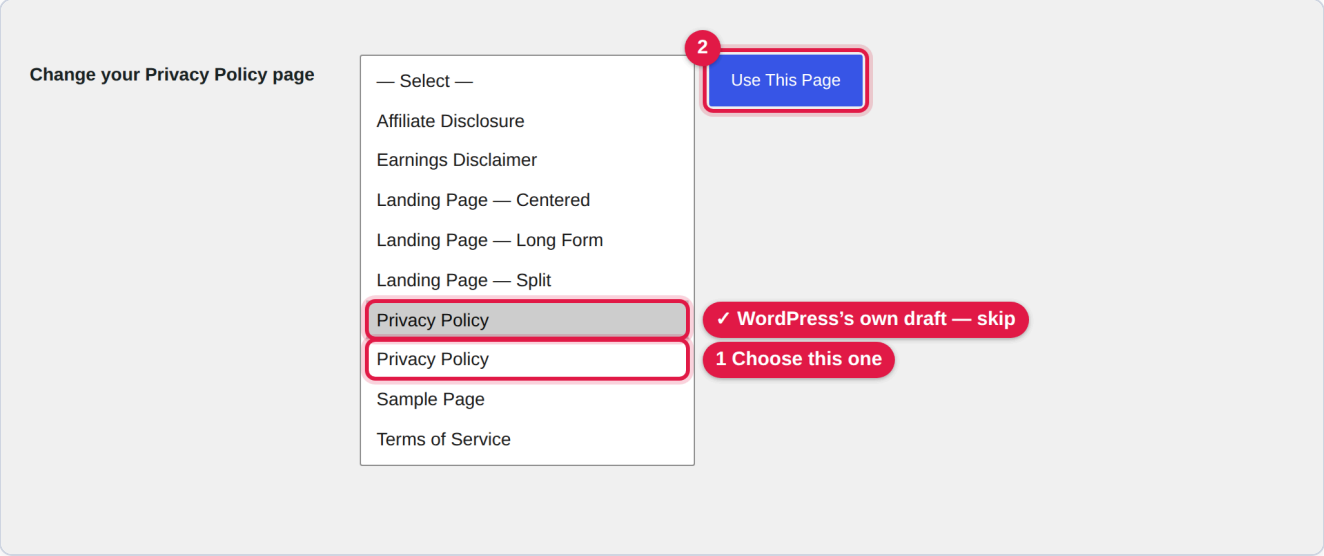

STEP 11

Point WordPress at your Privacy Policy

Go to **Settings** › **Privacy**.

WordPress creates its own draft privacy page when it's installed, so your page list now has two pages called *Privacy Policy*. Tell WordPress to use the one you just filled in and published.

1. Open the **Change your Privacy Policy page** list. *Privacy Policy* appears twice. The one with the checkmark is WordPress's own unpublished draft, so choose the **other** *Privacy Policy*.
2. Click **Use This Page**.

The list is drawn open here so you can see both entries. On your screen it's a dropdown.

YOUR EMAILS

Your email sequences

Go to **Settings** › **Affiliate Theme Settings** scroll down to **Your email sequences**.

Each landing page starts its own sequence of emails.

STATUS	WHAT IT MEANS
Live	New sign-ups on that page get its emails.
Waiting	The email sequence is ready but still needs something before it can be live. The form on that page stays hidden until then.
Needs update	Something in Resend is out of date, often because you changed a setting. Click **Finish setting up emails**. If it says an email *has an edit in Resend that is not published*, publish or discard that edit in Resend first, then save the settings again.
Off	You turned it off. New sign-ups on that page get no emails. If it adds *It was turned off in Resend.*, someone switched the automation off in Resend.
Not set up	The emails aren't in Resend yet, or Resend refused them. The line under it gives Resend's reason. Click **Finish setting up emails** to try again.

The buttons on each row

- **Turn off** stops an email sequence. New sign-ups on that page get no emails, and people partway through stop getting emails. **Turn on** starts it again for new sign-ups, but doesn't restart anyone who was stopped.
- **Reset these emails to the theme's copy** replaces anything you changed in them in Resend and puts back the original copy.
- **Open in Resend** opens the email sequence's automation at **resend.com**.

Changing your settings later

Change your affiliate link, mailing address, From name or Reply-to address, then click **Save Changes**, and the theme updates all your emails in Resend. People partway through an email sequence get the new details from their next email.

FINISH

Test your funnel

1. Check that **Your email sequences** shows your page's email sequence as **Live**.
2. Open a private or incognito browser window and go to your site's address.
3. Type an email address you own into the form and submit it.
4. Your browser should land on your affiliate link.
5. Within a few minutes, the first email arrives in your inbox. Check your spam and promotions folders too.
6. In Resend, open **Automations** and the email sequence for your page. Your sign-up shows there as a run.

If you sign up again with the same address on the same page, you're still sent to your affiliate link, but no new emails start: each address gets a page's email sequence once. The same address on a different landing page starts that page's email sequence.

HELP

Troubleshooting

Uploading the theme shows `The theme is missing the style.css stylesheet.`

You uploaded a different zip, or one whose contents were changed. Download `affiliate-theme.zip` again and upload it exactly as downloaded (see the Mac note in Step 1).

Uploading shows `The link you followed has expired.`

Reload the **Add Themes** page and upload again. If it keeps happening, your host's upload limit is too small. The theme is under 2 MB, so ask your host to allow uploads of at least 2 MB.

WordPress says `This theme is already installed.`

You're uploading a newer copy over an older one. Click **Replace installed with uploaded**. Your pages are safe: a theme update never overwrites a landing page or legal page you've edited, nor emails you've edited in Resend.

Under the API key: `This key can only send email. The theme needs a key with Full access.`

You pasted a key with **Sending access**, such as Resend's *Onboarding* key. Make a new key with **Full access** (Step 5), paste it over the dots and save.

Under the API key: `Resend did not accept this key.`

The key is wrong or was deleted in Resend. Make a new key with **Full access**, paste it over the dots and save.

Under the API key: `WordPress could not reach Resend. Reload this page in a minute.`

Your server couldn't reach Resend just then, or Resend was busy. It says nothing about your key. Reload the page in a minute. If it keeps happening, ask your host whether they block outgoing connections.

Saving shows `That is not a Resend API key. A Resend API key starts with re_.`

The text you pasted isn't a key. Copy it again from Resend; if you no longer have it, make a new one. The key you had before, if any, is kept.

Saving shows `The affiliate redirect URL is not a usable address. Start it with https://.`

Paste the complete link, including the `https://` at the start.

Resend says the domain is `already in use in another Resend account`

A domain can belong to only one Resend account. Use that account's API key here, or a different domain.

My DNS records still aren't verified

DNS changes can take a few hours to propagate. Check each record's name and value against **Your sending domain**, look for a name with your domain added twice (see Step 7), and make sure the CNAME records are **DNS only** on Cloudflare. Then click **Check** once more. You can also check **www.whatsmydns.net**.

Resend says `Partially Verified`

One record, often the `links` one, isn't verified yet, and Resend can't send until it is. Add the missing record or fix it.

My landing page says `Opt-in form is not ready:`

Only administrators see this note. Visitors see no form at all until it's fixed.

My forms vanished and every email sequence says Not set up

Open **Affiliate Theme Settings** and click **Finish setting up emails**: the theme finds them again without making new ones.

An email sequence says Needs update, or `It was turned off in Resend.`

The theme will turn off an email sequence you or someone else switched off in Resend; click **Turn on**.

`Open tracking is off for this domain.`

Your emails still send. See *If your domain was already in Resend* in Step 7.

`Click tracking is off for this domain.`

Your emails still send. See *If your domain was already in Resend* in Step 7.

Visitors see `Please try again in a moment.` **or** `Please try again in a few minutes.`

The first means Resend was busy for a second. The second means more than five sign-ups came from one internet address within ten minutes, which stops someone filling your list with fake addresses.

Visitors see `Service unavailable. Please try again shortly.`

Your server got no answer from Resend. It's usually brief. If it lasts, check that the line under your API key reads **Resend accepted this key.**

Visitors see `Something went wrong. Please try again.`

Resend refused the sign-up, or the page's email sequence is turned off.

Emails stopped arriving

You may have reached your Resend plan's daily or monthly limit. Check your usage in Resend, under **Metrics**.

A legal page isn't in my footer

Only published pages are linked. Open the page and click **Publish**. The link then appears on every page at once.

How do I change the copyright line in the footer?

Go to **Appearance** › **Editor** › **Patterns** › **Footer**, open the footer, click the *© 2026 – All rights reserved.* line and type your own. Then save.

The legal pages that come with this theme are a starting template, not legal advice. Review them for your own business, or have a professional review them.
